

AUDYNT Pool Game Overview

The AUDYNT Pool Game is a blockchain-based participation game built on the TRON blockchain for secure and transparent transaction processing. The system operates under predefined rules with publicly verifiable on-chain transactions for transparency and traceability.

1. Subscription & Pool Entry

To participate in the Pool Game, users must:

- Pay a one-time monthly subscription fee of \$3 to activate access to the game.
- Contribute \$5 to join the active pool round.

All payments and contributions are processed through TRON blockchain transactions, making them publicly visible and independently verifiable.

2. Pool Flow Mechanism

- Each new participant entry contributes to the progression of the pool.
- A participant's contribution is algorithmically routed to support a previous participant who is next in sequence.
- As more users join, the system advances automatically, allowing participants to move through their cycle.

The entire process is governed by automated smart-contract logic, not manual intervention.

3. Pool Completion & Receiving

- A participant completes a game cycle after receiving a total of \$10 from the pool.
- Once a cycle is completed, the participant may:

- * Exit the pool, or
- * Re-enter the game by starting a new cycle under the same conditions.

4. System Operation & Transparency

- The Pool Game continues operating as long as users voluntarily participate.
- There is no central wallet manually holding participant funds.
- All transactions follow predefined rules and are executed automatically.
- Every transaction can be independently verified on the public TRON ledger.

Important Participation Notice

- Participation is completely voluntary.
- Cycle completion depends on continued activity within the pool.
- There are no guaranteed outcomes or timelines.
- This system is presented as a participation game, not an investment or income-generating product.
- Users should only participate with funds they are comfortable using for gameplay.
- Failure to confirm payment after receiving may result in an IP ban.

Why TRON?

- Fast transaction confirmations
- Very low network fees
- Public and transparent blockchain ledger
- Reliable smart-contract execution

Summary

The AUDYNT Pool Game is a rule-based blockchain participation game powered by the TRON

network. Users subscribe, enter the pool, and may complete cycles as the game progresses. The system focuses on transparency, automation, and voluntary user participation.
